CSCI 375

Starter Project #3

Overview

Starter Project #3 in Software Engineering, CSCI 375, at Howard University taught by Prof. Burge is an essential hands on project for computer science students to learn to give and receive feedback on code, write basic git commands, and format code properly. My approach was to come into this project with patience for my partner and to give feedback that was precise but not nitpicky. Although I knew my code already ran properly, I made sure to look over my code to not make silly mistakes that I would regret hearing feedback about. I also noted formatting, functions, and more on my code to look for in my partner's code.

Feedback You Received

I received multiple pieces of feedback on different topics. I received 1 comment on removing dead data, 1 comment on making the code look more professional, and 1 comment on combining a section into a single loop. Looking at the feedback, my code needed improvement mainly on cleanliness and readability.

Feedback You Gave

My partner, AbbyUchenna, had functioning and readable code. I made sure to start with a few comments pointing out what she did right like 'useful' and 'well spaced!' I then included 2 comments about clarification; more comments and asking the purpose of a function. Lastly, I included 1 comment adding to the code to improve its functionality. My aim was to give diverse, uplifting feedback so it will be both useful and not too critical on the receiving end.

Improvements You Implemented

Trinity Singletary

Professor Burge

Software Engineering

CSCI 375

I improved the readability and formatting of my code because my feedback was mainly focused on improving that area.

Static Analysis Results

Black was used to improve my style issues. By looking into the Black Github and using the commands as instructed, my code improved quickly. Originally, many of the styling errors in my code were about not enough spaces in between functions. Also, another common error was using spaces instead of indents.

Regression Testing

I verified correctness by submitting my code in Starter Project #3 code checker. I

kept tweaking the code until I received a green check mark indicating 0 errors or mistakes.

Reflection

I learned that code reviews may take a few days instead of hours even if the change in the code is minimal. However, despite the long amount of time to complete a simple review, the improvement is fruitful and more than I could do on my own. I also learned that although I may see my code as perfect, other people provide different viewpoints that I may have never thought to include, so being open to feedback means being open to ideas I never thought about before.
